

Chapter 7: Measuring Light

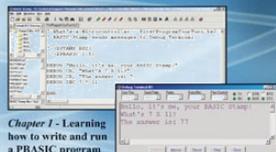

PARALLAX 

What's a Microcontroller?

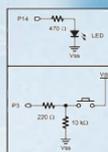

by Andy Lindsay

Introductory BASIC Stamp programming with simple circuits including LEDs and pushbuttons.

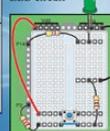

Hours to completion: 40
Level of Difficulty (out of 10): 3

Chapter 1 - Learning how to write and run a PBASIC program

Chapter 3 - Wiring a pushbutton and LED circuit

Learn electronics with the world's most popular microcontroller, the BASIC Stamp 2.

Presentation based on:

Parallax is also not responsible for any personal damage, including that to life and health, resulting from use of any of our products. You take full responsibility for your BASIC Stamp application, no matter how life threatening it may be.

Devices that Contain Light Sensors

Pushbuttons and dials are examples of pressure and rotation sensors, but there are a variety of sensors used for a variety of purposes: Temperature, smoke, tilt, vibration and so on.

Light sensors are also a type used in a variety of applications:

- ✓ Automatic street lights
- ✓ TV remotes using Infrared (non-visible light).
- ✓ Camera flash and exposure controls

Introducing the Photoresistor

What's a Microcontroller?

While there are a variety of light sensors, a very popular one is the photoresistor in that it is easy to use and inexpensive.

As the name implies, it is a resistor that reacts to light. The active ingredient Cadmium Sulfide (CdS) allows electrons to flow more easily when light energy hits it, thus lowering its resistance (opposition to current flow).

The brighter the light the lower the resistance.

Just as with a carbon resistor, the photoresistor can be used with the BASIC Stamp in an RC circuit to obtain a value in relation to the amount of resistance, or in this case the amount of light hitting the sensor.

Figure 7-1
Photoresistor Schematic and Part Drawing.

The photoresistor's cadmium sulfide coated light collecting surface is shown at the top of the part's drawing.

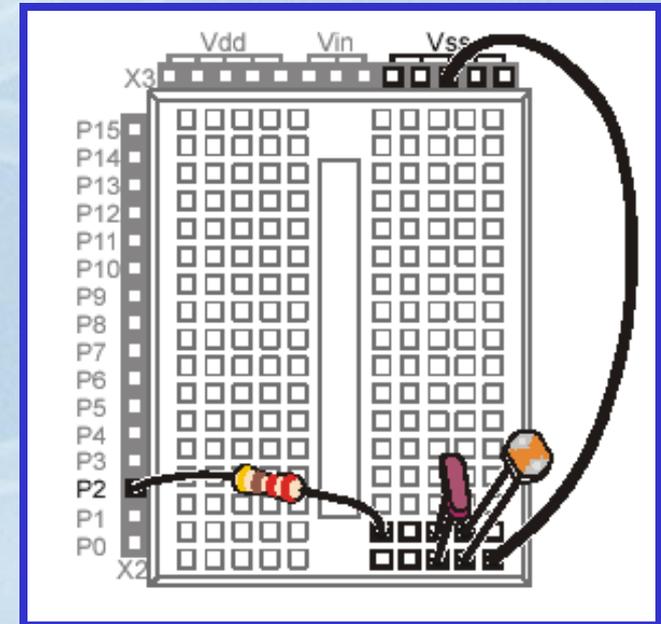

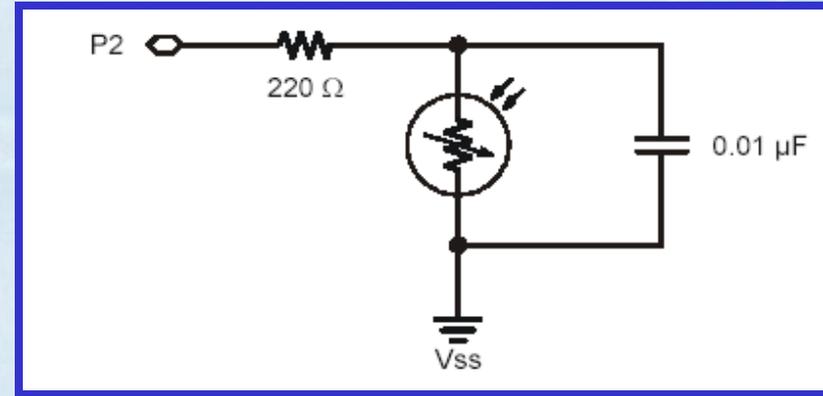

Activity #1: Build & Test Light

Meter

Just as with the RC Time circuits in Chapter 5, the capacitor is charged by the output (P2 in this case) and the time to discharge through the resistor is measured.

In this case, as light level changes, discharge time will change.

What's a Microcontroller?

- ✓ What happens to the value of **time** as the light level changes? When is it lowest? Highest?

```
' What's a Microcontroller - TestPhotoresistor.bs2
' Read photoresistor in RC-time circuit using RCTIME command.
' {$STAMP BS2}
' {$PBASIC 2.5}

time VAR Word

DO
  HIGH 2
  PAUSE 100
  RCTIME 2, 1, time
  DEBUG HOME, ? time, " "
LOOP
```

Activity #2: Graphing Light Level

Monitoring of sensors is a need in industry to ensure systems are operating within specifications.

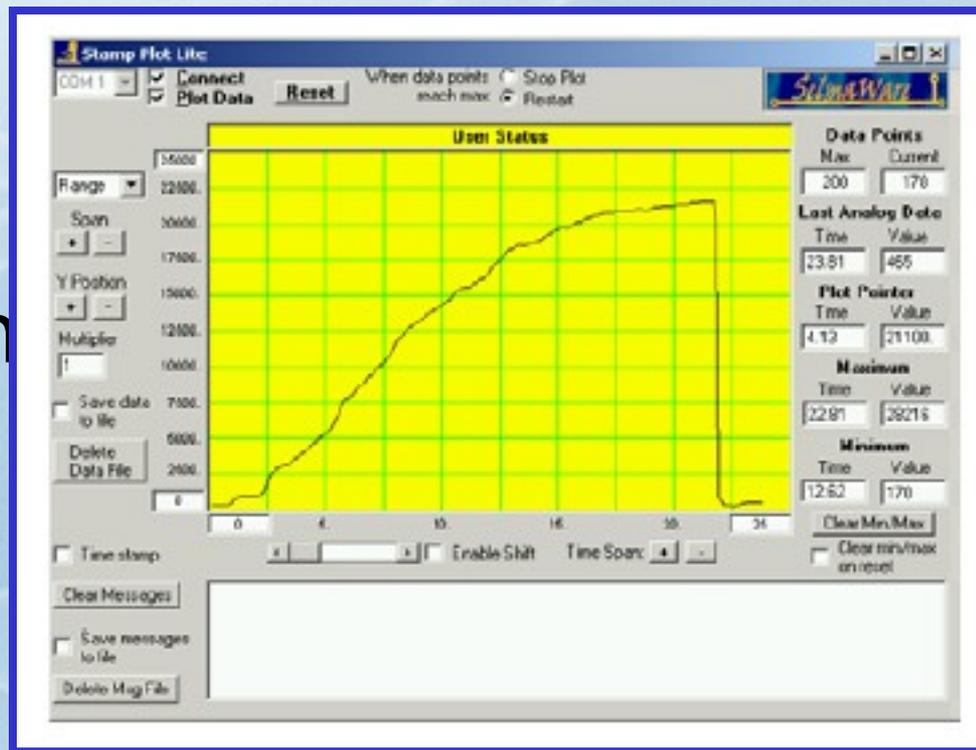

Stamp Plot Lite is a PC-based graphing program for monitoring data graphically.

Using Stamp Plot Lite

This image shows a plot of the light level. Note how the value increases from left to right then drops again suddenly?

What do the values represent as far as light level?

What's a Microcontroller?

- ✓ StampPlot Lite may be installed from your CD or downloaded from [Parallax's website](#).
- ✓ [Winzip](#) is required to extract and install the software.

Sending Measurements to Stamp Plot

Values to be graphed are sent using DEBUG and the DEC formatter. All data and instructions sent to Stamp Plot must end in a carriage return (CR).

For example, to plot the value of Time, the code would be:

```
DEBUG DEC Time, CR
```

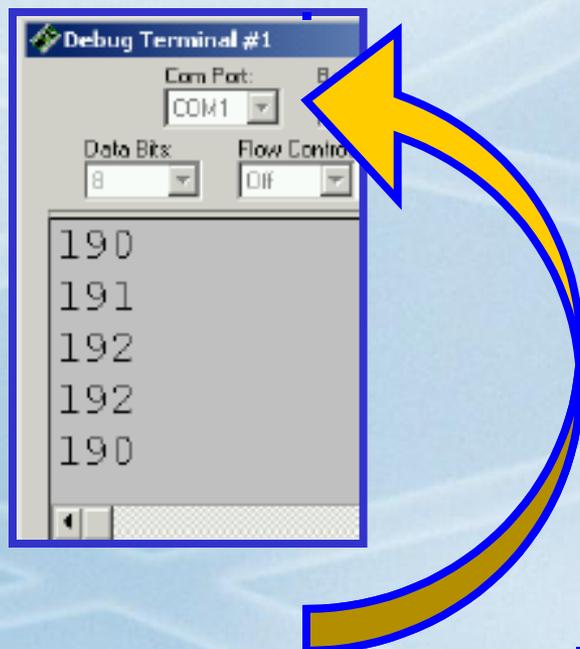

Stamp Plot may also be configured by sending control instructions instead of having to click the settings on the plot:

```
DEBUG "!AMAX 1250", CR,  
      "!TMAX 25", CR,  
      "!TMIN 0", CR,  
      "!SHFT ON", CR,  
      "!RSET",CR
```

- ✓ Load and run PlotPhotoresistor.bs2
- ✓ Verify the output in the DEBUG Window is a single column of values:

- ✓ Note the COM port

- ✓ Open Stamp Plot Lite
Menu→Program→Stamp Plot→Stamp Plot Lite
- ✓ Change the COM port to match the one from the DEBUG Window.
- ✓ Close the DEBUG Window. *Only 1 applications can have access to the COM Port at anyone time.*

- ✓ Click **Connect** then **Plot Data** in Stamp Plot Lite

- ✓ Press and release the **Reset button** on your HomeWork board to re-start your program to catch the DEBUG statements at the start of the program.
- ✓ The light level should now be plotting.
- ✓ Experiment with the Span and Time Span + and - buttons to adjust your plot.

Activity #3: Tracking Light Events

Programs remain in memory even when power is removed because it resides in special type of memory, EEPROM (E-E-PROM).

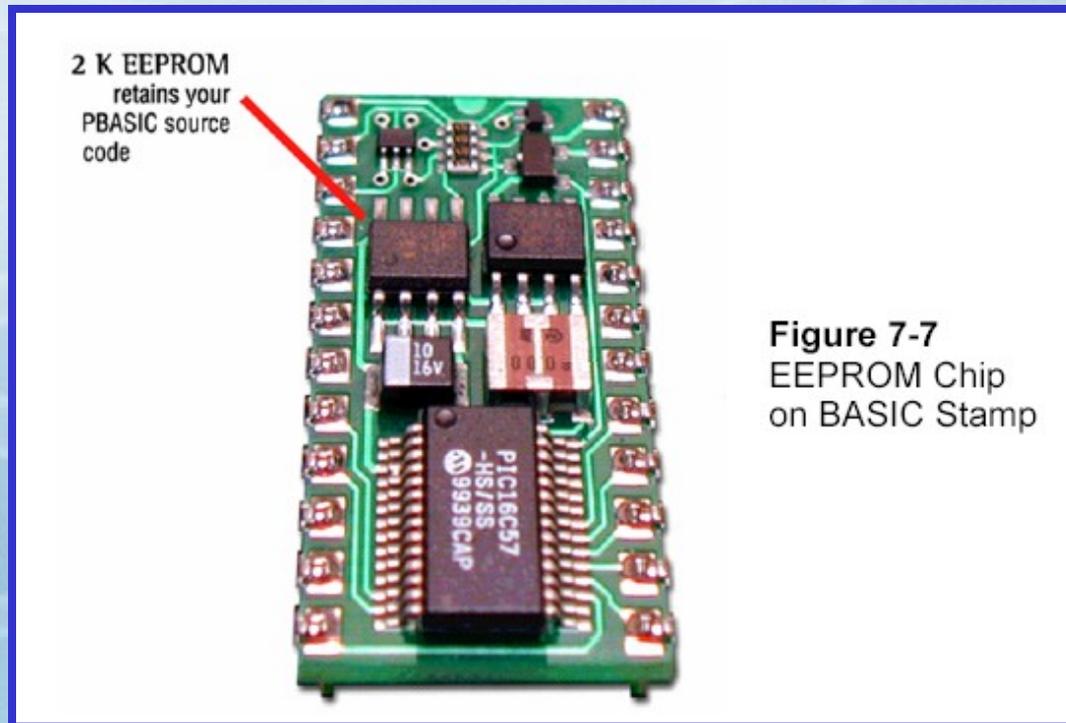

Figure 7-7
EEPROM Chip
on BASIC Stamp

The Memory Map (Click Run→Memory Map) shows RAM usage for variables and EEPROM usage for the current program. Notice that programs are stored in EEPROM from bottom-up.

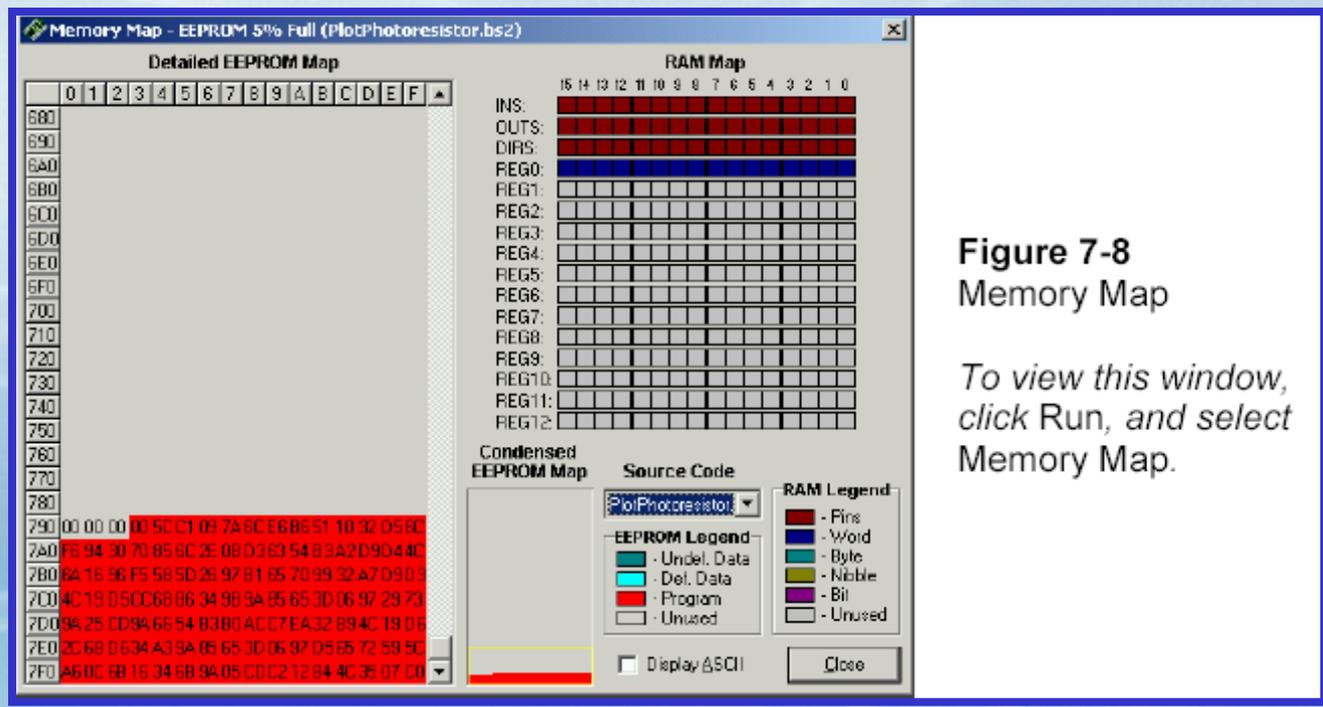

Figure 7-8 Memory Map
To view this window, click Run, and select Memory Map.

Writing to EEPROM

BASIC Stamp programs can also use the EEPROM for data storage.

WRITE Locations, {WORD} Data Item

For example, to store the value of 195 in address location 7:

WRITE 7, 195

To store values greater than 255, the Word parameter must be specified:

WRITE 8, Word 659

WRITE 10, Word 50012

Note that location 9 is skipped because using Word required 2 bytes to hold the value.

StoreLightMeasurementsInEeprom.

bs2

The StoreLightMeasurementsInEeprom program stored 30 measurements of light into EEPROM (from locations 0 to 58 with each taking 2 bytes).

```
FOR eepromAddress = 0 TO 58 STEP 2
  HIGH 2
  PAUSE 5000
  RCTIME 2, 1, time
  DEBUG DEC2 eepromAddress,
        " ", DEC time, CR
  WRITE eepromAddress, Word time
NEXT
```

What's a Microcontroller?

Reading From EEPROM

The READ instruction is used to read data from EEPROM:

READ Location, {Word} Data Item

- ✓ Read a byte and save in byte variable littleRR:

READ 7, littleRR

- ✓ Read a word value and store in Word variable eepromValueA:

READ 8, Word eepromValueA

ReadLightMeasurementsFromEeprom.bs

2

The

ReadLightMeasurementsFromEeprom will read and display the values from EEPROM

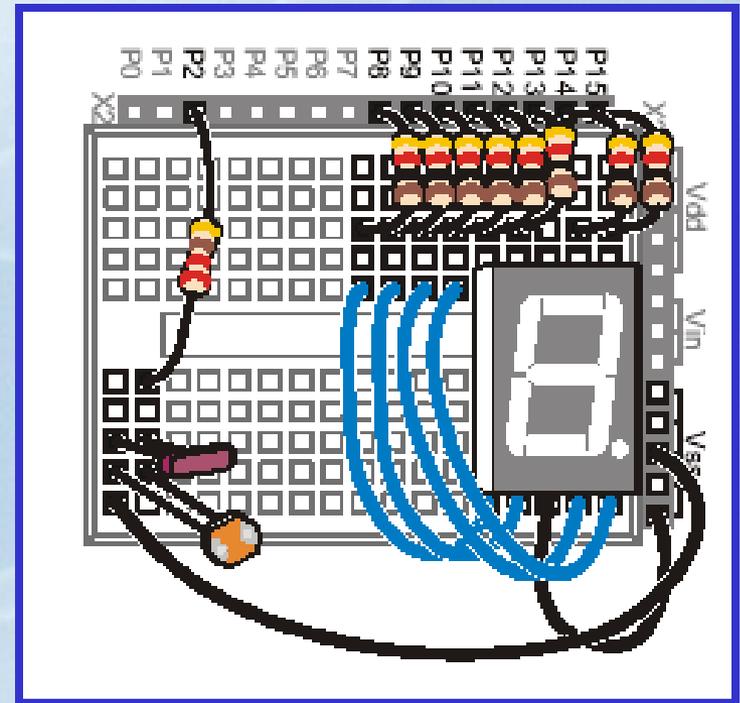

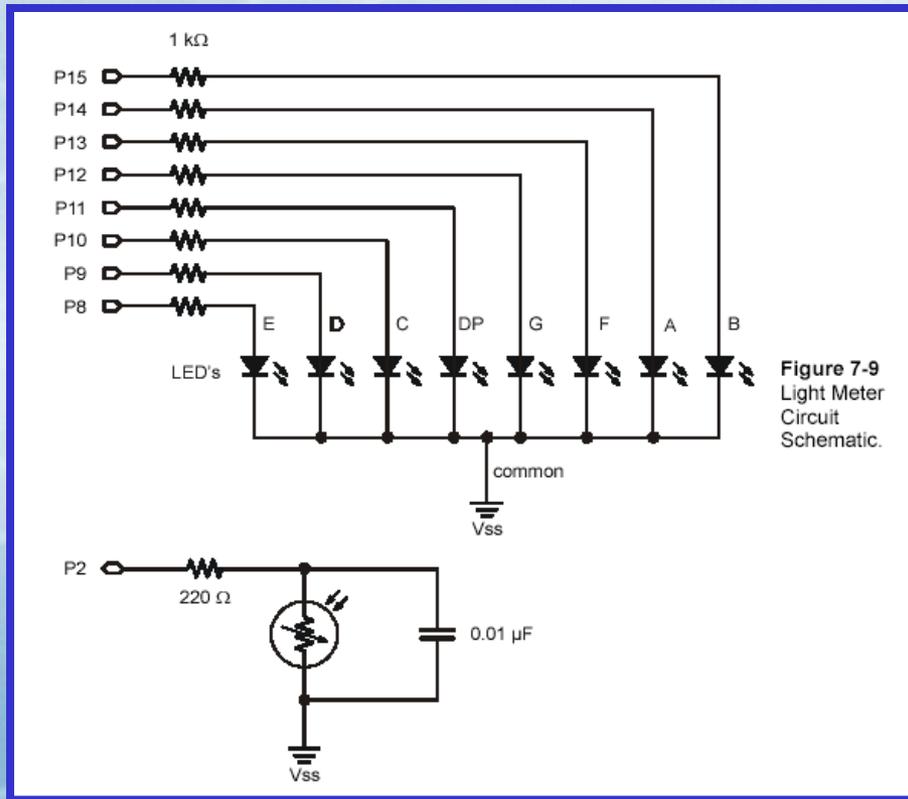

```
FOR eepromAddress = 0 TO 58 STEP 2
  READ eepromAddress, Word time
  DEBUG DEC2 eepromAddress, " ", DEC time, CR
NEXT
```

Activity #4: Simple Light Meter

Simple light meter uses the 7-segment LED to indicate the light strength.

What's a Microcontroller?

Using GOSUB

A **GOSUB** is a branch to another section of the program defined by a label. Once complete, the execution returns to after the **GOSUB** call.

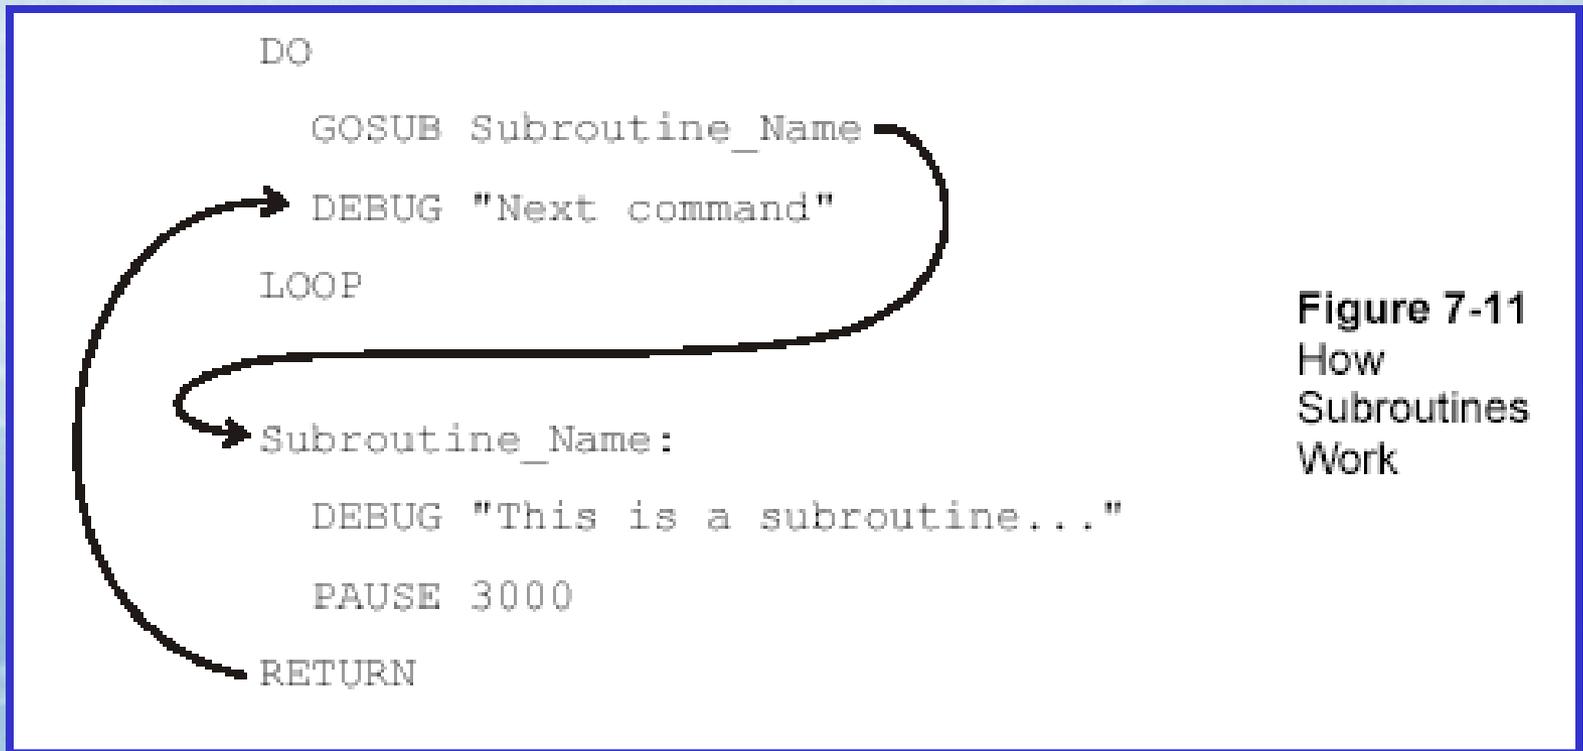

Figure 7-11
How
Subroutines
Work

What's a Microcontroller?

All subroutines called with a **GOSUB** MUST end with a **RETURN**.

If GOSUBs and RETURNs are not properly matched, it can lead to improper operation of your BASIC Stamp program.

GOSUBs allow code to be re-used and makes coding cleaner by having the main DO...LOOP call subroutines to perform the various tasks of the program. From the main routine, you can get an idea of what the program will perform.

```
DO                                ' Main routine.
  GOSUB  Get_Rc_Time
  GOSUB  Delay
  GOSUB  Update_Display
LOOP
```

LightMeter.bs2 uses the principles of RCTIME with the Photoresistor and LOOKUP with the 7-segment display to create a light meter.

By using a PAUSE length defined by the time value, LED segments will cycle at a speed dependent on light level.

Chapter #6 Review

What's a Microcontroller?

1. A photoresistor's _____ changes based on the amount of light.
2. The _____ command is used to send values to Stamp Plot for plotting.
3. Programs are stored to _____ memory.
4. The _____ command stores data in the EEPROM.
5. The _____ command reads data from EEPROM.
6. The _____ command causes execution to branch to a subroutine.
7. The _____ command must be used at the end of a subroutine.
